Activity

Skiing

Went for a tour around Fairy Lake today. There was 6-8" of lower density new snow. The underlying snowpack was highly variable. The deepest we encountered was in the 2-3' range on windloaded aspects with a stout crust at the interface with the new snow. Some very small (>1mm) facets were already forming underneath this crust. The new snow appeared to be bonding pretty well however wind slabs were present but not reactive.

Region

Bridger Range

Location (from list)

Naya Nuki Bowl

Observer Name

Henry Coppolillo
