

Eaglehead (Portal Creek)

Date

Sun, 11/15/2020 - 16:11

Activity

Skiing

105 cm on the ground on the north side of Eaglehead Mountain today. The lower 60 cm is all various types of facets, with another 30-50 cm of new snow from the past few days on top. Stability tests were kind of all over the place but they all concluded with an “N” breaking somewhere near the middle of the snowpack. Our snow pit observations were confirmed by lots of wumphing and shooting cracks on the way up. Despite ripping winds and a lot of snow transport going on the ski conditions were still quite good at and below tree line.

Region

Southern Gallatin

Observer Name

Henry Coppolillo
