

Meldrum Mountain, Yellowstone NP

Date

Wed, 03/17/2021 - 12:15

Activity

Skiing

Our group noted a large collapse, including a very loud whoomph and shooting cracks while ascending the SW ridgeline of Meldrum Mountain at roughly 8,000ft.

The snow here was between 40cm - 70cm and still had quite a weak, faceted layer underneath.

After noting the thin, weak snow, we opted to stay on ridge-lines and ski lower angle terrain, and had excellent corn skiing.

Region

Southern Gallatin

Location (from list)

Specimen Creek

Observer Name

Matt Standal
