

Lick Creek

Date

Wed, 12/15/2021 - 13:00

Activity

Skiing

Great Skiing out at Lick Creek today. I found 40cm of new snow (light wind effect on the easterly side) on the main south face that was sitting directly on the ground. The north aspect had a total depth on 90cm and closer to 30cm of new snow. The storm snow was right side up, starting at F and moving to F-. The only instability noted was a CT17Sc result where the new snow/old snow interface was. No propagation on ECT.

Region

Northern Gallatin

Location (from list)

Lick Creek
