

Fingers Meadow - Bridger Bowl

Date

Tue, 11/15/2022 - 11:30

Activity

Skiing

We toured up to the Fingers and around the corner to Boundary Chute. The snowpack was 1-2.5 feet deep. The pits we dug were 37-60cm. One was in the Fingers Meadow (ECTX) and the second in Boundary (ECTP24 - with low energy and unclear shear 13cm from the ground). The basal layers are faceting but are still 4F+ to 1F hardness. [Stability](#) was looking pretty good where we were today. There was a couple of inches of new snow up high, and the mid-mountain wind was transporting it into drifts up to 6" deep. We saw no avalanches or signs of instability, but I suspect a skier or rider could find a drift big enough avalanche in some of the ridge terrain

Region

Bridger Range

Location (from list)

Bridger Bowl

Observer Name
