

Stable results on Wheeler Mountain

Date

Fri, 12/23/2022 - 14:15

Activity

Skiing

Went up Wheeler this afternoon and found general stability. Dug a couple of pits around on E and SE aspects at around 6800ft, ECTx in both, about 20 to 30cm of weaker snow on the ground, but it was less faceted than expected given the cold snap recently. Pole probed and dug down by hand at about 8400ft and found a very similar structure.

Region

Northern Gallatin

Location (from list)

Wheeler Mountain

Observer Name

Brian Richards
