

Several natural avalanches in the Crazies

Date

Mon, 01/30/2023 - 16:00

Not sure if this will be useful information, but it was interesting to me. Yesterday (1/30) in the illumination of the low-angle evening sun, I could see at least 4 crowns in the Crazies with a pair of binoculars from downtown Livingston. Mostly W-SW facing slopes above treeline on the group of peaks surrounding and including Iddings Peak. I am used to seeing wind-scoured W aspects, and had never noticed such conspicuous slides from town. Crowns estimated 2-3 feet deep, and most slides looked to be a couple hundred feet wide but I could tell. I'm sure today's wind will remodel and transport all remaining evidence to the E side of the range.

Region

Out of Advisory Area

Location (from list)

Crazy Peak
