

Isolated instabilities at the playground

Date

Fri, 01/05/2024 - 13:40

Activity

Skiing

Toured out to the playground and found isolated areas of instabilities. Some areas out of the trees had shallow 1-3 inch thick slabs which failed on isolation in quick hand pits but did not appear to propagate in ECTs. No shooting cracks or big collapses were observed. The good skiing in the tress would probably improve Doug's Attitude.

Region

Bridger Range

Location (from list)

The Playground

Observer Name

Charlie Bayles
