

loose snow and wind slabs in Bridgers

Date

Sat, 04/05/2025 - 18:30

Activity

Skiing

Observed multiple D1-1.5 natural dry loose avalanches (and some tiny [wind slab](#) pockets under the ridge [cornice](#)) that likely occurred during peak warming around 2-3 PM. North/sheltered aspects from ~9- 8.5k held an average of 8+ inches of dry, drifted snow. Early AM to mid-afternoon, very active wind transport followed by tapered winds and a rapid increase in temp. Also observed one small [wind slab](#) occurring between Saddle & the Football Field, possibly skier-triggered.

Region

Bridger Range

Location (from list)

Bridger Peak

Observer Name

Gabrielle Antonioli
